Pedr	o Ca	balar
------	------	-------

• • • • • • • • • • • •

- Context: temporal reasoning with transition systems.
- Typical reasoning problems: simulation, explanation, planning, diagnosis, verification.
- ... but focusing on Knowledge Representation (KR)

< □ > < 同 > < 回 > < 回 > < 回

### Keypoint: representation

Which are the desirable properties of a good KR?

- Simplicity
- 2 Natural understanding: clear semantics
- Allows automated reasoning methods that:
  - are efficient
  - or at least, their complexity can be assessed

< (□) < 三 > (□)

Which are the desirable properties of a good KR?

- Simplicity
- 2 Natural understanding: clear semantics
- Allows automated reasoning methods that:
  - are efficient
  - or at least, their complexity can be assessed
- Elaboration tolerance [McCarthy98]

Small changes in the problem  $\Rightarrow$  small changes in specification

  - are efficient
  - or at least, their complexity can be assessed
- Elaboration tolerance [McCarthy98]

Small changes in the problem  $\Rightarrow$  small changes in specification

Typical problems of lack of elaboration: frame, ramification, qualification

< 同 > < 回 > .

Which are the desirable properties of a good KR?

- Simplicity
- Natural understanding: clear semantics
- Allows automated reasoning methods that:
  - are efficient
  - or at least, their complexity can be assessed
- Elaboration tolerance [McCarthy98]

Small changes in the problem  $\Rightarrow$  small changes in specification

Typical problems of lack of elaboration: frame, ramification, qualification

Example: automata satisfy everything, but lack elaboration

• • • • • • • • • • • •

• Elaboration tolerance for action domains:

Representing Action and Change by Logic Programs [Gelfond & Lifschitz 93] use Answer Set Programming (ASP)

• • • • • • • • • • • •

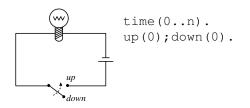

• Elaboration tolerance for action domains:

Representing Action and Change by Logic Programs [Gelfond & Lifschitz 93] use Answer Set Programming (ASP)

However, ASP has no temporal constructs

< 🗇 🕨 < 🖃 🕨

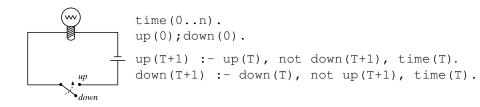

• Initially, a lamp switch can be *up* or *down*.

Pedro	Cab	alar
-------	-----	------

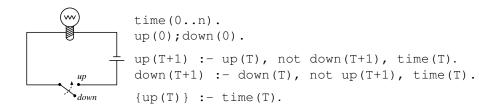

• • • • • • • • • • • • •

- Initially, a lamp switch can be *up* or *down*.
- By default, the switch state persists by inertia,

(I) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1))

- Initially, a lamp switch can be *up* or *down*.
- By default, the switch state persists by inertia,
- but we can arbitrarily close it at any moment.

< ロ > < 同 > < 回 > < 回 >

Examples of problems that cannot be solved in ASP:

• Is there a reachable state with up and down false?

• • • • • • • • • • • •

Examples of problems that cannot be solved in ASP:

- Is there a reachable state with up and down false?
- Once up becomes true, does it remain so forever?

Examples of problems that cannot be solved in ASP:

- Is there a reachable state with up and down false?
- Once up becomes true, does it remain so forever?
- The switch cannot be closed infinitely often without eventually damaging the lamp

- ✓ Many uses in AI: planning, ontologies, multi-agent systems, ...

# Linear-time Temporal Logic (LTL) $\Box$ , $\diamond$ , $\circ$ , **U**...

X Monotonic: action domain representations manifest frame problem

# Linear-time Temporal Logic (LTL) $\Box$ , $\diamond$ , $\circ$ , **U**...

X Monotonic: action domain representations manifest frame problem

In model checking no worry on this: usually, logical description of automaton states

# Linear-time Temporal Logic (LTL) $\Box$ , $\diamond$ , $\circ$ , **U**...

X Monotonic: action domain representations manifest frame problem

In model checking no worry on this: usually, logical description of automaton states even worse! nothing less elaboration tolerant than an automaton

# Linear-time Temporal Logic (LTL) $\Box$ , $\diamond$ , $\circ$ , **U**...

X Monotonic: action domain representations manifest frame problem

In model checking no worry on this: usually, logical description of automaton states even worse! nothing less elaboration tolerant than an automaton

X NMR attempts for LTL: limited syntax, only for queries, control rules, etc. Not really embodied in LTL

#### Our proposal

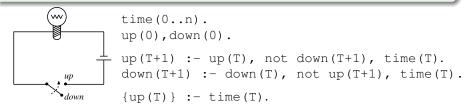

Temporal Equilibrium Logic (TEL) [C\_&Pérez 07] TEL = ASP + LTL

• ASP: logical characterisation Equilibrium Logic [Pearce 96]

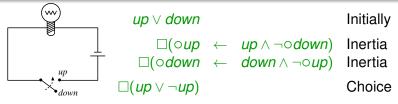

• LTL: We add temporal operators  $\Box$ ,  $\Diamond$ ,  $\circ$ , U, R.

Result: Temporal Stable Models for any arbitrary LTL theory.

- Initially, a lamp switch can be closed (*p*) or open (*q*).
- By default, the switch state persists by inertia,
- but we can arbitrarily close it at any moment.

- Initially, a lamp switch can be closed (*p*) or open (*q*).
- By default, the switch state persists by inertia,
- but we can arbitrarily close it at any moment.

Idea: LTL syntax, but keeping ASP semantics

## Equilibrium Logic

Equilibrium Logic [Pearce96]: generalises stable models for arbitrary propositional theories.

• Interpretation = pairs  $\langle H, T \rangle$  of sets of atoms  $H \subseteq T$ 

- Interpretation = pairs  $\langle H, T \rangle$  of sets of atoms  $H \subseteq T$
- Example:  $H = \{p, q\}, T = \{p, q, r, s\}.$

- Interpretation = pairs  $\langle H, T \rangle$  of sets of atoms  $H \subseteq T$
- Example:  $H = \{p, q\}, T = \{p, q, r, s\}$ . Intuition:

• When H = T we have a classical model.

 $\begin{array}{l} \text{Satisfaction of formulas} \\ \langle H, T \rangle \models \varphi \quad \Leftrightarrow \quad ``\varphi \text{ is proved"} \end{array}$ 

#### Satisfaction of formulas

$$\begin{array}{lll} \langle H,T\rangle\models\varphi &\Leftrightarrow \quad "\varphi \text{ is proved"} \\ \langle T,T\rangle\models\varphi &\Leftrightarrow \quad "\varphi \text{ potentially true"} &\Leftrightarrow \quad T\models\varphi \text{ classically} \end{array}$$

イロト イヨト イヨト イヨト

#### Satisfaction of formulas

 $\begin{array}{lll} \langle H,T\rangle\models\varphi &\Leftrightarrow \quad ``\varphi \text{ is proved"} \\ \langle T,T\rangle\models\varphi &\Leftrightarrow \quad ``\varphi \text{ potentially true"} &\Leftrightarrow \quad T\models\varphi \text{ classically} \end{array}$ 

•  $\langle H, T \rangle \models p$  if  $p \in H$  (for any atom p)

#### Satisfaction of formulas

- $\langle H, T \rangle \models p$  if  $p \in H$  (for any atom p)
- $\bullet \ \land, \lor \text{ as always }$

#### Satisfaction of formulas

 $\begin{array}{lll} \langle H, T \rangle \models \varphi & \Leftrightarrow & "\varphi \text{ is proved"} \\ \langle T, T \rangle \models \varphi & \Leftrightarrow & "\varphi \text{ potentially true"} & \Leftrightarrow & T \models \varphi \text{ classically} \end{array}$ 

- $\langle H, T \rangle \models p$  if  $p \in H$  (for any atom p)
- $\land,\lor$  as always
- $\langle H, T \rangle \models \varphi \rightarrow \psi$  if both
  - $T \models \varphi \rightarrow \psi$  classically
  - $\langle H, T \rangle \models \varphi$  implies  $\langle H, T \rangle \models \psi$

#### Satisfaction of formulas

 $\begin{array}{lll} \langle H,T\rangle\models\varphi &\Leftrightarrow \quad \text{``}\varphi \text{ is proved''} \\ \langle T,T\rangle\models\varphi &\Leftrightarrow \quad \text{``}\varphi \text{ potentially true''} &\Leftrightarrow \quad T\models\varphi \text{ classically} \end{array}$ 

- $\langle H, T \rangle \models p$  if  $p \in H$  (for any atom p)
- ∧, ∨ as always
- $\langle H, T \rangle \models \varphi \rightarrow \psi$  if both
  - $\begin{array}{l} \text{-} \quad \textit{$T \models \varphi \rightarrow \psi$ classically$}\\ \text{-} \quad \langle \textit{$H, T \rangle \models \varphi$ implies } \langle \textit{$H, T \rangle \models \psi$} \end{array}$
- Negation  $\neg F$  is defined as  $F \rightarrow \bot$
- $\langle H, T \rangle \models \varphi$  implies  $T \models \varphi$  (proved implies potentially true)

Definition (Equilibrium/stable model) A model  $\langle T, T \rangle$  of  $\Gamma$  is an equilibrium model iff

there is no  $H \subset T$  such that  $\langle H, T \rangle \models \Gamma$ .

When this holds, T is called a stable model.

Definition (Equilibrium/stable model)

A model  $\langle T, T \rangle$  of  $\Gamma$  is an equilibrium model iff

```
there is no H \subset T such that \langle H, T \rangle \models \Gamma.
```

When this holds, *T* is called a stable model.

In other words, all assumptions T are eventually proved H

A (10) > A (10) > A

#### Definition (Temporal Equilibrium Model)

of a theory  $\Gamma$  is a model  $M = \langle \mathbf{T}, \mathbf{T} \rangle$  of  $\Gamma$  such that there is no  $\mathbf{H} < \mathbf{T}$  satisfying  $\langle \mathbf{H}, \mathbf{T} \rangle$ ,  $\mathbf{0} \models \Gamma$ .

• Temporal Equilibrium Logic (TEL) is the logic induced by temporal equilibrium models.

Definition (Temporal Stable Model)

**T** is a temporal stable model of a theory  $\Gamma$  iff  $\langle T, T \rangle$  is a temporal equilibrium model of  $\Gamma$ .

Example 1: TEL models of □(¬p → ○p). It's like an infinite program:

Example 1: TEL models of □(¬p → ○p). It's like an infinite program:

$$eg p \rightarrow op$$
  
 $eg op \rightarrow o^2 p$   
 $eg o^2 p \rightarrow o^3 p$   
 $\vdots$ 

• TEL models have the form

corresponding to LTL models of  $\neg p \land \Box(\neg p \leftrightarrow \circ p)$ .

#### • Example 2: consider TEL models of $\Diamond p$

Example 2: consider TEL models of ◊p is like p ∨ ∘p ∨ ∘∘p ∨ …

 Example 2: consider TEL models of ◊p is like p ∨ ∘p ∨ ∘∘p ∨ ...

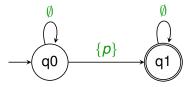

TEL models have the form

corresponding to LTL models of  $\neg p$  **U**  $(p \land \circ \Box \neg p)$ 

• In ASP terms, how can we represent temporal stable models? infinitely long! infinitely many!

 In ASP terms, how can we represent temporal stable models? infinitely long! infinitely many!

 Answer: using Büchi automata. An infinite-length word is accepted iff it visits some acceptance state infinitely often

- Example 3: consider TEL models of □◊*p*
- In LTL this means *p* occurs infinitely often.

• • • • • • • • • • • •

- Example 3: consider TEL models of □◊*p*
- In LTL this means *p* occurs infinitely often.
- So take any LTL model T like that, i.e.,  $\langle T, T \rangle$  is a total THT model.

< 🗇 🕨 < 🖃 🕨

- Example 3: consider TEL models of □◊*p*
- In LTL this means *p* occurs infinitely often.
- So take any LTL model T like that, i.e.,  $\langle T, T \rangle$  is a total THT model.
- Now build some H < T by removing one p at some point. But then  $\langle H, T \rangle$  is also a model since H contains  $\infty 1 = \infty p$ 's yet!

- Example 3: consider TEL models of □◊*p*
- In LTL this means *p* occurs infinitely often.
- So take any LTL model T like that, i.e.,  $\langle T, T \rangle$  is a total THT model.
- Now build some H < T by removing one p at some point. But then  $\langle H, T \rangle$  is also a model since H contains  $\infty 1 = \infty p$ 's yet!
- Therefore,  $\Box \Diamond p$  alone has no TEL models.

#### • We can still express infinitely often by disabling minimality of p

• • • • • • • • • • • • •

- We can still express infinitely often by disabling minimality of p
- This can be done adding the (excluded middle) axiom

$$\Box(\rho \lor \neg \rho) \tag{EM}$$

< < >> < <</p>

(a choice rule in ASP)

- We can still express infinitely often by disabling minimality of p
- This can be done adding the (excluded middle) axiom

$$\Box(\boldsymbol{\rho} \vee \neg \boldsymbol{\rho}) \tag{EM}$$

(a choice rule in ASP)

• In fact, if we add (EM) for all atoms, TEL collapses into LTL

Example 4: consider TEL models of the pair of formulas

$$\Box(\neg \circ p \rightarrow p) \\ \Box(\circ p \rightarrow p)$$

• Example 4: consider TEL models of the pair of formulas

 $\Box(\neg \circ p \rightarrow p) \\ \Box(\circ p \rightarrow p)$ 

• Curiosity: implications go backwards in time

• Example 4: consider TEL models of the pair of formulas

 $\Box(\neg \circ p \rightarrow p) \\ \Box(\circ p \rightarrow p)$ 

- Curiosity: implications go backwards in time
- This is LTL-equivalent to:

 $\Box \big( (\neg \circ \rho \to \rho) \land (\circ \rho \to \rho) \big)$ 

• Example 4: consider TEL models of the pair of formulas

 $\Box(\neg \circ p \rightarrow p) \\ \Box(\circ p \rightarrow p)$ 

- Curiosity: implications go backwards in time
- This is LTL-equivalent to:

$$\Box ((\neg \circ p \to p) \land (\circ p \to p))$$

$$\equiv \Box (\underbrace{\neg \circ p \lor \circ p}_{\top} \to p)$$

$$\equiv \Box p$$

• Example 4: consider TEL models of the pair of formulas

$$\Box(\neg \circ p \rightarrow p) \ \Box(\circ p \rightarrow p)$$

• So LTL models make *p* true forever,

• Example 4: consider TEL models of the pair of formulas

 $\Box(\neg \circ p \rightarrow p) \\ \Box(\circ p \rightarrow p)$ 

• So LTL models make *p* true forever, but we won't get TEL models!

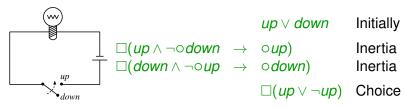

• Example 4: consider TEL models of the pair of formulas

 $\Box(\neg \circ p \rightarrow p) \\ \Box(\circ p \rightarrow p)$ 

- So LTL models make *p* true forever, but we won't get TEL models!
- We can build a strictly smaller model with H where from some point on T, p becomes false forever

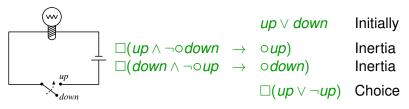

• Example 5: lamp switch again

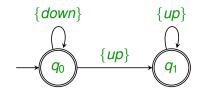

< ロ > < 同 > < 回 > < 回 >

• Example 5: lamp switch again

We never get  $up \land down$ Once up is true, it remains so forever

TIME 2020 37 / 58

Reasonable behavior when theories "look like" logic programs

• • • • • • • • • • • •

- Reasonable behavior when theories "look like" logic programs
- But what happens with arbitrary temporal formulas?
   e.g. ◊p ∧ (¬□◊q → ◊(p U q))

(I) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1))

# Normal form

 Temporal theories can be reduced to a normal form closer to logic programs

#### Normal form

- Temporal theories can be reduced to a normal form closer to logic programs
- temporal literals =  $\{a, \neg a, \bullet a, \neg \bullet a \mid a \in Atoms\}$

#### Definition (Temporal rule)

A temporal rule is either:

- an initial rule  $B \rightarrow A$
- a dynamic rule  $\widehat{\circ} \Box (B \to A)$
- a fulfillment rule  $\Box(\Box p \rightarrow q)$  or  $\Box(p \rightarrow \Diamond q)$

where  $B = b_1 \land \cdots \land b_n$  with  $n \ge 0$ ,  $A = a_1 \lor \cdots \lor a_m$  with  $m \ge 0$ 

- $b_i, a_j$  = temporal literals for dynamic rules
- $b_i$ ,  $a_j$  = regular literals a,  $\neg a$  for initial rules

*p*, *q* = atoms

Pedro Cabalar

### Normal form

- $b_i, a_j$  = regular literals  $a, \neg a$  for initial rules
- *p*, *q* = atoms

#### A temporal logic program is a set of temporal rules.

#### Syntactic Fragment

• An interesting fragment are present-centered programs

- initial rule  $B \rightarrow A$
- dynamic rule  $\widehat{\circ} \Box (B \rightarrow A)$
- final rule  $\Box$  (  $\mathbf{F} \rightarrow (B \rightarrow A)$  )

present-centered = A does not contain temporal operators

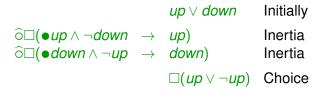

(I) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1))

• An interesting fragment are present-centered programs

- initial rule  $B \rightarrow A$
- dynamic rule  $\widehat{\circ} \Box(B \to A)$
- final rule  $\Box$  (**F**  $\rightarrow$  (**B**  $\rightarrow$  **A**))

present-centered = A does not contain temporal operators

• Example of present-centered program:

< ロ > < 同 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ >

• Tool telingo [C\_, Kaminski, Morkisch & Schaub 19] Temporal extension of ASP solver clingo

• • • • • • • • • • • • •

• Tool telingo [C\_, Kaminski, Morkisch & Schaub 19] Temporal extension of ASP solver clingo

```
#program initial.
up;down.
#program dynamic.
up :- 'up, not down.
down :- 'down, not up.
#program always.
{up}.
```

- We can use a more general syntactic fragment past-future =  $\alpha \rightarrow \beta$  where
  - $\alpha$  may only contain past operators
  - $\beta$  may only contain future operators

and none of them contains  $\rightarrow$ 

A (1) > A (2) > A

- We can use a more general syntactic fragment past-future =  $\alpha \rightarrow \beta$  where
  - $\alpha$  may only contain past operators
  - $\beta$  may only contain future operators

and none of them contains  $\rightarrow$ 

• Example: the integrity constraint

```
shoot \land \blacksquare unloaded \land \bullet \blacklozenge shoot \rightarrow \bot
```

can be expressed in telingo as:

- We can use a more general syntactic fragment past-future =  $\alpha \rightarrow \beta$  where
  - $\alpha$  may only contain past operators
  - $\beta$  may only contain future operators

and none of them contains  $\rightarrow$ 

• Example: the integrity constraint

```
shoot \land \blacksquare unloaded \land \bullet \blacklozenge shoot \rightarrow \bot
```

can be expressed in telingo as:

:- shoot, &tel { <\* unloaded & < <? shoot }.

### **Beyond LTL**

- In [Bosser et al. 18, C\_ et al. 19] we extend TEL and TEL<sub>f</sub> to the syntax of Linear Dynamic Logic (LDL) [De Giacomo & Vardi 13]
- DEL = LDL + ASP.

(I) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1))

### **Beyond LTL**

- 2 Definitions and examples
- 3 Automata-based computation
- 4 Temporal Logic Programming
- 5 Conclusions and open topics

< 🗇 🕨 < 🖃 >

• • • • • • • • • • • • •

- TEL = suitable framework for temporal reasoning + ASP
- Simple semantics thanks to just merging two logical formalisms: Equilibrium Logic + LTL.
- Implementations: telingo, abstem, stelp
- It constitutes a new open field. Many open topics ....

## **Open topics**

- Open theoretical problems:
  - Kamp's theorem: monadic EL(<) can be transformed into THT? (possibly not)
  - Interdefinability of operators
  - Can temporal stable models be captured by LTL?
- Finite traces: axiomatisation, automata-based methods, grounding
- New syntactic subclasses with satisfiability lower than EXPSPACE [Bozzelli & Pearce 15]
- Planning tool. Compare to planners using LTL control knowledge like TLPIan [Bacchus & Kabanza 00].
- Encoding action languages

# Temporal Modalities in Answer Set Programming Pedro Cabalar
